A general purpose laboratory instrument for the accurate measurement of alpha, beta and gamma radiation. An eleven-stage photo-multiplier tube is used and a Sodium Iodide crystal of diameter $1\frac{1}{2}$" (3.8 cm) and length $1\frac{1}{4}$" (2.86 cm) is provided for gamma measurement.

Alternative holders for alpha and beta assay work can also be supplied.

The heavy adjustable stand enables the probe unit to be used in any position.

Versene*

. . . Decontaminating Agent for Radioactive Deposits

Once anything has been made radioactive, there is no way to destroy this radioactivity. But, radioactive contamination which is usually a deposit of insoluble compounds (metallic oxides) can be solubilized (chelated) with *Versene* and washed away with large volumes of water. This results in great dilution and removes the danger. For deposits on exposed surfaces the addition of a good detergent formulation is recommended. In living organisms *Versene* has been used experimentally to detoxify heavy metals and to help remove radioactive deposits. Send for sample. Write Dept. I for Technical Bulletin No. 2. Chemical counsel available on request.
